(54) Title: BIOMARKERS OF CYCLIN-DEPENDENT KINASE MODULATION

(57) Abstract: Biomarkers having expression patterns that correlate with a response of cells to treatment with one or more cdk modulating agents, and uses thereof. Also provided are methods for testing or predicting whether a mammal will respond therapeutically to a method of treating cancer that comprises administering an agent that modulates cdk activity.

The present application includes a Sequence Listing. A compact disc labeled "COPY 1 - SEQUENCE LISTING PART" contains the Sequence Listing as D0310 PCT.sequence listing.ST25.txt. The Sequence Listing is 13394 KB in size and was recorded on July 28, 2004. The compact disc is 1 of 3 compact discs. Duplicate copies of the compact disc are labeled "COPY 2 - SEQUENCE LISTING PART" and "COPY 3 - SEQUENCE LISTING PART." Also included is a computer readable form of the Sequence Listing.

The compact disc and duplicate copies are identical and are hereby incorporated by reference into the present application.

BACKGROUND OF THE INVENTION:

The present invention relates generally to the field of pharmacogenomics and, more specifically, to pharmacodynamic biomarkers whose expression patterns correlate with a response of cells to treatment with one or more cdk modulating agents.

Uncontrolled proliferation is a hallmark of cancer cells. Over the past two decades, it has become increasingly clear that the molecules, which directly control cell cycle progression, accumulate defects during tumorigenesis. These defects can result in the loss of checkpoint control and/or the inappropriate activation of the drivers of cell cycle progression, the cyclin-dependent kinases (referred to as "cdks" or "CDKs"). Misregulation of cdk function occurs with high frequency in major solid tumor types (including breast, colon, ovarian, prostate, and NSCL carcinomas). Therefore, inhibitors of cdks and cell cycle progression have the potential to fill a large therapeutic need.

The cdks are serine/threonine protein kinases that are the driving force behind the cell cycle and cell proliferation. Cdks are multisubunit enzymes composed of at least a catalytic subunit and a regulatory (cyclin) subunit. Morgan, D. O., Nature 1995; 374:131-134. To date, nine cdks (cdk1 through cdk9) and eleven cyclin subunits have been identified which can form in excess of thirteen active kinase complexes. Gould, K. L. (1994) in Protein Kinases (Woodgett, J. R., ed), pp. 149-

166, Oxford University Press, Oxford. In normal cells, many of these enzymes can be categorized as G1, S, or G2/M phase enzymes which perform distinct roles in cell cycle progression. van den Heuvel, S., and Harlow, E., Science 1993; 262: 2050-2054. Cdks phosphorylate and modulate the activity of a variety of cellular proteins that include tumor suppressors (e.g., RB, p53), transcription factors (e.g., E2F-DP1, RNA pol II), replication factors (e.g., DNA pol α, replication protein A), and organizational factors which influence cellular and chromatin structures (e.g., Histone HI, lamin A, MAP4). Nigg, E. A., Trends in Cell Biology 1993; 3:296-301; Rickert, P. et al., Oncogene 1996; 12:2631-2640; Dynlacht, B. D. et al., Mol Cell Biol 1997; 17:3867-3875; Ookata, K. et al., Biochemistry 1997; 36:15873-15883.

5

10

15

20

25

30

Cdk activity is regulated through a variety of co-ordinated mechanisms, which include cell cycle dependent transcription and translation, cell cycle dependent proteolysis, subcellular localization, post-translational modifications, and interaction with cdk inhibitor proteins (referred to as "CKIs"). Pines, J., and Hunter, T., Cell 1989; 58:833-846; King, R. W. et al., Science 1996; 274:1652-1659; Li, J. et al., Proc Natl Acad Sci U S A 1997; 94:502-507; Draetta, G., and Beach, D., Cell 1988; 54:17-26; Harper, J. W., Cancer Surv 1997; 29:91-107. It is through these mechanisms that cell cycle checkpoints are constructed. This realization that checkpoint control is implemented through the regulation of cdk function has made the cdks and their regulatory pathways compelling targets for the development of chemotherapeutic agents. The p27/cdk2/cyclinE/RB checkpoint pathway has been clearly implicated in tumorigenesis.

Numerous reports have demonstrated that both the co-activator, cyclin E, and inhibitor, p27, of cdk2 are either over-expressed or under-expressed respectively in solid tumors. Porter, P. L. et al., Nat Med 1997; 3:222-225; Kitahara, K. et al., Int J Cancer 1995; 62:25-28; Wang, A. et al., J Cancer Res Clin Oncol 1996; 122:122-126; Keyomarsi, K. et al., Cancer Res 1994; 54:380-385; Courjal, F. et al. Int J Cancer 1996; 69:247-253; Akama, Y. et al., Jpn J Cancer Res 1995; 86:617-621; Tan, P. et al., Cancer Res 1997; 57:1259-1263; Catzavelos, C. et al., Nat Med 1997; 3:227-230; Fredersdorf, S. et al., Proc Natl Acad Sci U S A 1997; 94:6380-6385. Their altered expression has been shown to correlate with increased cdk2 activity levels and poor prognosis.

In the early clinical development of anti-cancer agents, clinical trials are typically designed to evaluate the safety, tolerability, and pharmacokinetics, as well as to identify a suitable dose and schedule for further clinical evaluation. Increasingly, there is a need to also evaluate the pharmacologic effects of novel agents in early clinical trials, particularly in cases where dosing to maximum tolerated doses may not be appropriate. As a result, there is considerable interest in identifying pharmacodynamic (PD) biomarkers that correlate with the pharmacologic modulation of a tumor target. These PD biomarkers may be tumor-specific, but ideally should also be expressed in accessible surrogate tissues such as skin or peripheral blood cells. The identification of these PD biomarkers may be carried out by analyzing changes in specific polypeptides or mRNA, as predicted by the known biology associated with the molecule targeted by the agent of interest. Alternatively, PD biomarkers can be identified by analyzing global changes in polypeptides or mRNA in cells or tissues exposed to efficacious doses of the agent. Once identified, these PD biomarkers can be used to demonstrate the desired pharmacologic modulation (e.g., inhibition) of a tumor target upon the achievement of an appropriate level of agent in the patient.

There remains a need to identify biomarkers whose expression patterns correlate with a response of cells to treatment with one or more cdk modulating agents.

The development of microarray technologies for large scale characterization of mRNA expression pattern has made it possible to systematically search for molecular biomarkers whose expression is modulated by drug treatment. Such technologies and molecular tools have made it possible to monitor the expression level of a large number of transcripts within a cell population at any given time (see, e.g., Schena et al., 1995, Science, 270:467-470; Lockhart et al., 1996, Nature Biotechnology, 14:1675-1680; Blanchard et al., 1996, Nature Biotechnology, 14:1649; U.S. Patent No. 5,569,588).

SUMMARY OF THE INVENTION:

5

10

15

20

25

30

The invention provides methods and procedures for determining patient sensitivity to one or more agents that modulate cyclin-dependent kinase (cdk) activity. The invention also provides methods for determining or predicting whether an

individual requiring therapy for a disease state or disorder such as cancer will or will not respond to treatment, prior to administration of the treatment, wherein the treatment comprises of one or more agents that modulate cdk activity. The one or more agents that modulate cdk activity can be small molecules or biological molecules. In one aspect, the agent is a small molecule that inhibits cyclin-dependent kinase 2 (cdk2)/cyclin E.

5

10

15

20

25

30

The invention also provides a method for testing or predicting whether a mammal will respond therapeutically to a method of treating cancer comprising administering an agent that modulates cdk activity, wherein the method comprises: (a) measuring in the mammal the level of at least one biomarker selected from the biomarkers of Table 1; (b) exposing the mammal to the agent that modulates cdk activity; (c) following the exposing of step (b), measuring in the mammal the level of the at least one biomarker, wherein a difference in the level of the at least one biomarker measured in step (c) compared to the level of the at least one biomarker measured in step (a) indicates that the mammal will respond therapeutically to said method of treating cancer.

The invention also provides a method for determining whether a mammal is responding to an agent that modulates cdk activity, comprising: (a) exposing the mammal to the agent; and (b) following the exposing of step (a), measuring in the mammal the level of at least one biomarker selected from the biomarkers of Table 1, wherein a difference in the level of the at least one biomarker measured in step (b), compared to the level of the at least one biomarker in a mammal that has not been exposed to said agent, indicates that the mammal is responding to the agent that modulates cdk activity.

As used herein, responding includes, for example, a biological response (e.g., a cellular response) or a clinical response (e.g., improved symptoms, a therapeutic effect, or an adverse event) in the mammal.

The invention also provides a method for determining whether a mammal is responding to an agent that modulates cdk activity, comprising: (a) obtaining a biological sample from the mammal; (b) measuring in said biological sample the level of at least one biomarker selected from the biomarkers of Table 1; (c) correlating said level of at least one biomarker with a baseline level; and (d) determining whether the

mammal is responding to an agent that modulates cdk activity based on said correlation.

5

10

15

20

25

30

As used herein, the baseline level used for the correlation can be determined by one of skill in the art. In one aspect, the baseline level is the level of the at least one biomarker selected from the biomarkers of Table 1 in a mammal that has not been exposed to the agent. In another aspect, the baseline level is the level of the at least one biomarker selected from the biomarkers of Table 1 in the mammal that will be treated with a cdk modulating agent but has not yet been exposed to the agent. In yet another aspect, the baseline level is the level of the at least one biomarker selected from the biomarkers of Table 1 in the mammal that has been treated with a cdk modulating agent, and wherein the baseline level is selected at a point during the treatment with the cdk modulating agent. The point can be, for example, an established time period or measurement of a criteria (e.g., a biological or clinical response) set prior to initiation of the treatment.

A difference between the level of at least one biomarker from the mammal and the baseline level that is statistically significant can be used in the methods of the invention. A statistically significant difference between the level of at least one biomarker from the mammal and the baseline level is readily determined by one of skill in the art and can be, for example, at least a two-fold difference, at least a three-fold difference, or at least a four-fold difference in the level of the at least one biomarker.

The invention also provides a method for identifying a mammal that will respond therapeutically to a method of treating cancer comprising administering an agent that modulates cdk activity, wherein the method comprises: (a) measuring in the mammal the level of at least one biomarker selected from the biomarkers of Table 1; (b) exposing a biological sample from the mammal to the agent; (c) following the exposing in step (b), measuring in said biological sample the level of the at least one biomarker, wherein a difference in the level of the at least one biomarker measured in step (c) compared to the level of the at least one biomarker measured in step (a) indicates that the mammal will respond therapeutically to the said method of treating cancer.

As used herein, respond therapeutically refers to the alleviation or abrogation of the cancer. This means that the life expectancy of an individual affected with the cancer will be increased or that one or more of the symptoms of the cancer will be reduced or ameliorated. The term encompasses a reduction in cancerous cell growth or tumor volume. Whether a mammal responds therapeutically can be measured by many methods well known in the art, such as PET imaging.

5

10

15

20

25

The invention also provides a method for identifying a mammal that will respond therapeutically to a method of treating cancer comprising administering an agent that modulates cdk activity, wherein the method comprises: (a) exposing a biological sample from the mammal to the agent that modulates cdk activity; (b) following the exposing of step (a), measuring in said biological sample the level of at least one biomarker selected from the biomarkers of Table 1, wherein a difference in the level of the at least one biomarker measured in step (b), compared to the level of the at least one biomarker in a mammal that has not been exposed to said agent that modulates cdk activity, indicates that the mammal will respond therapeutically to said method of treating cancer.

The invention also provides a method for determining whether an agent modulates cdk activity in a mammal, comprising: (a) exposing the mammal to the agent; and (b) following the exposing of step (a), measuring in the mammal the level of at least one biomarker selected from the biomarkers of Table 1, wherein a difference in the level of said biomarker measured in step (b), compared to the level of the biomarker in a mammal that has not been exposed to said agent, indicates that the agent modulates cdk activity in the mammal.

The invention also provides a method for determining whether a mammal has been exposed to an agent that modulates cdk activity, comprising (a) exposing a biological sample from the mammal to the agent; and (b) following the exposing of step (a), measuring in the biological sample the level of at least one biomarker selected from the biomarkers of Table 1, wherein a difference in the level of said biomarker measured in step (b), compared to the level of the biomarker in a mammal that has not been exposed to said agent, indicates that the mammal has been exposed to an agent that modulates cdk activity.

5

10

15

20

25

30

The mammal can be, for example, a human, rat, mouse, dog, rabbit, pig sheep, cow, horse, cat, primate, or monkey.

The method of the invention can be an *in vivo* or an *in vitro* method. In one aspect, the step of measuring in the mammal the level of at least one biomarker is *in vitro* and comprises taking a biological sample from the mammal and then measuring the level of the at least one biomarker in the biological sample. The biological sample can comprise, for example, at least one of whole fresh blood, peripheral blood mononuclear cells, frozen whole blood, fresh plasma, frozen plasma, urine, saliva, skin, hair follicle, bone marrow, or tumor tissue.

In one aspect of the invention, the method of the invention comprises use of the biomarker W28729 (SEQ ID NO:1246).

The level of the at least one biomarker can be, for example, the level of protein and/or mRNA transcript of the at least one biomarker.

The invention also provides an isolated biomarker selected from the biomarkers of Table 1. The biomarkers of the invention comprise sequences selected from the nucleotide and amino acid sequences provided in Table 1 and the Sequence Listing, including fragments and variants thereof.

The invention also provides one or more biomarkers that can serve as targets for the development of therapies for disease treatment. Such targets may be particularly applicable for treatment of cancers or tumors.

The invention also provides a biomarker set comprising two or more biomarkers selected from the biomarkers of Table 1.

The invention also provides kits for determining or predicting whether a patient would be susceptible or resistant to a treatment that comprises one or more agents that modulate cdk activity. In one aspect, the patient has a cancer.

In one aspect, the kit comprises a suitable container that comprises one or more specialized microarrays of the invention, one or more agents that modulate cdk activity for use in testing cells from patient tissue specimens or patient samples, and instructions for use. The kit may further comprise reagents or materials for monitoring the expression of a biomarker set at the level of mRNA or protein.

The invention also provides a kit that comprises two or more biomarkers selected from the biomarkers of Table 1.

5

10

15

20

25

30

The invention also provides a kit that comprises at least one of an antibody and a nucleic acid for detecting the presence of at least one of the biomarkers selected from the biomarkers of Table 1. In one aspect, the kit further comprises instructions for determining whether or not a mammal will respond therapeutically to a method of treating cancer comprising administering an agent that modulates cdk activity. In another aspect, the instructions comprise the steps of (a) measuring in the mammal the level of at least one biomarker selected from the biomarkers of Table 1, (b) exposing the mammal to the agent, (c) following the exposing of step (b), measuring in the mammal the level of the at least one biomarker, wherein a difference in the level of the at least one biomarker measured in step (c) compared to the level of the at least one biomarker measured in step (a) indicates that the mammal will respond therapeutically to said method of treating cancer.

The invention also provides screening assays for determining if a patient will be susceptible or resistant to treatment with one or more agents that modulate cdk activity.

The invention also provides a method of monitoring the treatment of a patient having a disease, wherein said disease is treated by a method comprising administering one or more agents that modulate cdk activity.

The invention also provides individualized genetic profiles which are necessary to treat diseases and disorders based on patient response at a molecular level.

The invention also provides specialized microarrays, e.g., oligonucleotide microarrays or cDNA microarrays, comprising one or more biomarkers having expression profiles that correlate with either sensitivity or resistance to one or more agents that modulate cdk activity.

The invention also provides antibodies, including polyclonal and monoclonal, directed against one or more of the biomarker polypeptides. Such antibodies can be used in a variety of ways, for example, to purify, detect, and target the biomarker polypeptides of the invention, including both in vitro and in vivo diagnostic, detection, screening, and/or therapeutic methods.

The invention also provides a cell culture model to identify biomarkers whose expression levels correlate with cdk modulation.

The invention will be better understood upon a reading of the detailed description of the invention when considered in connection with the accompanying figures.

5 BRIEF DESCRIPTION OF THE FIGURES:

FIG. 1 illustrates a cdk biomarker identification strategy.

FIGS. 2A and 2B illustrate the reduction of cdk2 protein levels by cdk2 antisense oligonucleotides.

FIGS. 3A, 3B, and 3C illustrate the expression changes of the biomarker W28729 (SEQ ID NO:1246) in A2780s, PBMC, and xenograft A2780s tumors following treatment with a cdk inhibitor.

FIGS. 4A and 4B illustrate the regulation of W28729 expression in A2780 xenograft (FIG. 4A) and the mouse ortholog of W28729 in mouse PBMC (FIG. 4B).

FIGS. 5A and 5B illustrate W28729 gene expression in patients treated with N-5-[[5-(1,1-Dimethylethyl)-2-oxazolyl]methyl]thio]-2-thiazolyl-4-piperidinecarboxamide, 0.5-L-tartaric acid salt.

FIGS. 6A and 6B illustrate W28729 induction and its relation to baseline expression.

FIGS. 7A and 7B illustrate W28729 induction as a function of dose (FIG. 7A) and AUC (FIG. 7B).

FIG. 8 illustrates the prediction of W28729 changes by baseline expression of W28729 and the cdk2 inhibitor exposure.

FIG. 9 illustrates disease outcome, time to tumor progression (TTP) and W28729 changes.

DETAILED DESCRIPTION OF THE INVENTION:

As used herein, the term "agent that modulates cdk activity," also referred to herein as "cdk modulating agent," is intended to mean a substance that is a biological molecule or a small molecule, and formulations thereof, that is directly or indirectly involved in cdk activity and/or one or more pathways in which cdk is involved. The cdk modulating agent can be a cdk antagonist or inhibitor. The cdk modulating agent can also be a cdk agonist or activator.

In one aspect, the cdk modulating agent is directly or indirectly involved in cdk2 activity and/or one or more pathways in which cdk2 is involved. In another aspect, the cdk modulating agent is directly or indirectly involved in cdk1 activity and/or one or more pathways in which cdk1 is involved. In yet another aspect, the cdk modulating agent is directly or indirectly involved in cdk4 activity and/or one or more pathways in which cdk4 is involved.

5

10

15

20

25

30

Biological molecules include all lipids and polymers of monosaccharides, amino acids, and nucleotides having a molecular weight greater than 450. Thus, biological molecules include, for example, oligosaccharides and polysaccharides; oligopeptides, polypeptides, peptides, and proteins; and oligonucleotides and polynucleotides. Oligonucleotides and polynucleotides include, for example, DNA and RNA. Biological molecules further include derivatives of any of the molecules described above. For example, derivatives of biological molecules include lipid and glycosylation derivatives of oligopeptides, polypeptides, peptides, and proteins.

In addition to the biological molecules discussed above, the cdk modulating agents may also be small molecules. Any molecule that is not a biological molecule is considered herein to be a small molecule. Some examples of small molecules include organic compounds, organometallic compounds, salts of organic and organometallic compounds, saccharides, amino acids, and nucleotides. Small molecules further include molecules that would otherwise be considered biological molecules, except their molecular weight is not greater than 450. Thus, small molecules may be lipids, oligosaccharides, oligopeptides, and oligonucleotides and their derivatives, having a molecular weight of 450 or less.

It is emphasized that small molecules can have any molecular weight. They are merely called small molecules because they typically have molecular weights less than 450. Small molecules include compounds that are found in nature as well as synthetic compounds. In one embodiment, the cdk modulating agent is a small molecule that inhibits cdk or a pathway in which cdk is involved.

Numerous small molecules have been described as being useful to inhibit cdk including, for example, flavopiridol (Aventis Pharmaceuticals Inc., Bridgewater, New Jersey, U.S.A.) and CYC202 (Cyclacel Limited, Dundee, United Kingdom). Cdk

inhibitors also include, for example, the small molecules disclosed in U.S. Patent Nos. 6,040,321, 6,214,852, 6,262,096, 6,515,004, and 6,521,759.

In one aspect, the cdk modulating agent is a small molecule cdk inhibitor. In another aspect, the cdk modulating agent is a small molecule cdk2 inhibitor. In another aspect, the cdk modulating agent is a small molecule cdk1 inhibitor. In yet another aspect, the cdk modulating agent is a small molecule cdk4 inhibitor. In a further aspect, the cdk modulating agent is N-5-[[5-(1,1-Dimethylethyl)-2-oxazolyl]methyl]thio]-2-thiazolyl-4-piperidinecarboxamide, 0.5-L-tartaric acid salt.

5

10

15

20

25

30

The invention provides methods to monitor the response of patients to treatment with a cdk modulating agent. These methods are useful: (i) to follow the response of a patient over a course of treatment with a cdk modulating agent; (ii) to determine whether the specific cdk modulating agent selected for treatment is appropriate to the patient; (iii) to determine whether the dose of the cdk modulating agent being administered is appropriate to the patient; (iv) to determine whether the type and/or amount of cdk modulating agent being administered needs to be changed over the course of the treatment period; (v) to determine when treatment is complete; and (vi) to determine whether treatment that has been terminated needs to be restarted. These methods are also useful to identify whether a patient will benefit from treatment with a cdk modulating agent.

In one aspect, the invention provides a method of determining whether a patient receiving a treatment that comprises a cdk modulating agent has received sufficient treatment to inhibit cdk in the patient's tumors. In accordance with the invention, tumor or surrogate biopsies are obtained from a patient before and after treatment with a cdk modulating agent. The surrogate biopsies can be, for example, skin or peripheral blood. The cells are then assayed to determine the changes in the expression pattern of one or more biomarkers of the invention upon treatment with the cdk modulating agent, to determine whether cdk inhibition has been achieved by the treatment. Success or failure of the treatment can be determined based on the expression pattern of the test cells from the test tissue, e.g., tumor or cancer biopsy, as being relatively the same as or different from the expression pattern of one or more biomarkers. If the test cells show an expression profile which corresponds to that of the biomarker or biomarker set, it is predicted that the individual's cancer or tumor

has been exposed to a concentration of the modulating agent that is sufficient to, in one aspect, inhibit cdk. By contrast, if the test cells show a gene expression pattern that does not correspond to the biomarker or biomarker set, it is predicted that the modulating agent exposure has not been sufficient to, in one aspect, inhibit cdk.

5

10

15

20

25

30

In another aspect, the invention provides a method of monitoring the treatment of a patient having a disease treatable by a cdk modulating agent by comparing the expression profile of cells from a patient tissue sample, e.g., a tumor or cancer biopsy, following treatment to a biomarker or biomarker set. The isolated cells from the patient are assayed to determine their expression pattern to determine if a change of the expression profile has occurred so as to warrant a different treatment, such as treatment with a different cdk modulating agent, or to discontinue current treatment. The resulting expression profile of the cells following treatment with a cdk modulating agent is compared with the expression pattern of the biomarker or biomarker set.

Such a monitoring process can indicate success or failure of a patient's treatment with a cdk modulating agent based on the expression pattern of the cells isolated from the patient's sample as being relatively the same as or different from the expression pattern of the biomarker or biomarker set. Thus, if, after treatment with a cdk modulating agent, the test cells show a change in their expression profile from the biomarker or biomarker set, it can serve as an indicator that the current treatment should be modified, changed, or even discontinued. Such monitoring processes can be repeated as necessary or desired. The monitoring of a patient's response to a given treatment can also involve testing the patient's cells in the assay as described only after treatment with a cdk modulating agent, rather than before and after treatment with a cdk modulating agent.

The invention is based on the identification of specific pharmacodynamic biomarkers of cdk modulation. In accordance with the invention, oligonucleotide microarrays were used to measure the expression levels of a large number of genes in a panel of treated cell lines for which sensitivity to a cdk modulating agent was determined. The determination of the gene expression profiles in the treated cells allowed the identification of biomarkers whose expression levels highly correlate with

5

10

the modulation of cdk or a pathway in which cdk is involved. The biomarkers are thus useful for inferring the level of cdk modulation in a patient.

The biomarkers of the invention include polynucleotides, including full-length genes, open reading frames (ORFs), and partial sequences such as expressed sequence tags (ESTs) and structural RNA. In one aspect, the invention is directed to an isolated polynucleotide comprising a nucleotide sequence selected from the nucleotide sequences of Table 1 such as, for example, an isolated polynucleotide comprising the nucleotide sequence of SEQ ID NO:1264. The biomarkers further include polypeptides comprising the amino acid sequences encoded by these polynucleotides. The biomarkers of the invention include those provided below in Table 1. In one aspect, these polynucleotides and polypeptides are in isolated form.

TABLE 1

SEQ ID	Sequence	Genbank Accession	Symbol	Description

Analogs of the biomarkers provided in Table 1 are also within the scope of the invention. Analogs can differ from the naturally occurring biomarker in nucleotide or amino acid sequence or in ways that do not involve sequence, or both. Non-sequence

modifications include in vivo or in vitro chemical derivitization. Non-sequence modifications also include changes in acetylation, methylation, phosphorylation, carboxylation, or glycosylation.

5

10

15

20

25

30

Preferred analogs of the biomarkers provided in Table 1 (or biologically active fragments thereof) include those whose sequences differ from the wild-type sequences by one or more conservative amino acid substitutions or by one or more non-conservative amino acid substitutions, deletions, or insertions which do not abolish biological activity. Conservative substitutions typically include, for example, the substitution of one amino acid for another with similar characteristics, e.g., substitutions within the following groups: valine, glycine; glycine, alanine; valine, isoleucine, leucine; aspartic acid, glutamic acid; asparagine, glutamine; serine, threonine; lysine, arginine; and phenylalanine, tyrosine.

The biomarkers of the invention include any biological molecule that can be detected and quantified in a biological sample using standard biochemical assay methods, where the presence and/or quantity of the biomarker in the biological sample: (i) can be used to select an appropriate treatment; or (ii) can be used to monitor the efficacy and progress of treatment with a cdk modulating agent.

In one aspect, the invention includes the biomarker provided in SEQ ID NO:1246 and assigned GenBank Accession No. W28729. It has been discovered that this biomarker has an expression pattern that correlates with inhibition of cdk in cells upon treatment with a cdk modulating agent. The biomarker of SEQ ID NO:1246 was discovered to have the most consistent and robust regulation in response to cdk inhibition.

The invention also includes specialized microarrays, e.g., oligonucleotide microarrays or cDNA microarrays, comprising one or more biomarkers.

The invention also includes kits comprising a suitable container that comprises: one or more microarrays that comprise one or more biomarkers; one or more cdk modulating agents for use in testing cells from patient tissue specimens or patient samples; and instructions for use. In addition, kits contemplated by the invention can further include, for example, reagents or materials for monitoring the expression of biomarkers of the invention at the level of mRNA or protein, using other techniques and systems practiced in the art such as, for example, RT-PCR

5

10

15

20

25

30

assays, which employ primers designed on the basis of one or more of the biomarkers described herein, immunoassays, such as enzyme linked immunosorbent assays (ELISAs), immunoblotting, e.g., Western blots, or *in situ* hybridization, and the like, as further described herein.

The invention also includes antibodies, including polyclonal or monoclonal, directed against one or more of the biomarker polypeptides. Such antibodies can be used in a variety of ways, for example, to purify, detect, and target the biomarker polypeptides of the invention, including both *in vitro* and *in vivo* diagnostic, detection, screening, and/or therapeutic methods.

In carrying out any of the methods of the invention, the levels of either a single biomarker or a set of two or more different biomarkers can be assayed. Assay of more than one biomarker may serve to increase the accuracy of monitoring the response of the patient to treatment with the cdk modulating agent, such as the extent of cdk2 inhibition. Measurement of a plurality of biomarkers can be carried out by assaying the different biomarkers in either the same biological sample or in different biological samples taken from the same patient.

In one aspect, the invention provides a method to monitor the response of a patient being treated for a disorder by administration of a cdk modulating agent, comprising: (a) determining the amount of at least one biomarker in a first biological sample taken from the patient prior to an initial treatment with the agent; (b) determining the amount of the biomarker in at least a second biological sample from the patient subsequent to the initial treatment with the agent; and (c) comparing the amount of the biomarker present in the second biological sample with the amount of the biomarker present in the first biological sample; such that a detectable change in the amount of the biomarker in the second biological sample, and/or in any subsequent biological sample indicates that the patient is responding positively to the treatment with the agent. The detectable change can be a decrease or an increase in the amount of the biomarker in the second biological sample, and/or in any subsequent biological samples.

This method requires that at least two biological samples are taken from the patient at different time points. The first sample is typically obtained prior to an

initial treatment with the cdk modulating agent. A second sample is then obtained, and any subsequent samples are also then obtained, after treatment with the cdk modulating agent has begun. In this method, the biomarker is monitored to determine: (i) if the amount of the biomarker is decreasing, (ii) if the rate of decrease in the amount of the biomarker is increasing, (iii) if the amount of the biomarker is increasing, (iv) if the rate of increase in the amount of the biomarker is increasing, or (v) if the amount of biomarker is stabilizing, any one of which may indicate that the patient is responding positively to the treatment depending upon the specific circumstances.

5

10

15

20

25

30

The biomarkers described herein may be upregulated or downregulated following treatment with one or more cdk modulating agents.

When the biomarker is an upregulated biomarker, it is expected that the amount of the biomarker will increase following treatment with the cdk modulating agent, i.e., that there will be a detectable increase in the amount of the biomarker in the second biological sample (post administration of the cdk modulating agent) compared to the amount of biomarker in the first biological sample (prior to administration of the cdk modulating agent). If the biomarker is an upregulated biomarker and the level of the biomarker has not increased a predetermined or detectable amount, or if the rate of increase of the biomarker level is not sufficiently high, the treatment can be modified, such as by increasing the dosage or the number of treatments, or by changing the cdk modulating agent being administered to a more effective agent, or by combining the cdk modulating agent being used in the treatment with one or more other cdk modulating agents or therapies, or some combination thereof.

When the biomarker is a downregulated biomarker, it is expected that the amount of the biomarker will decrease following treatment with the cdk modulating agent, i.e., that there will be a detectable decrease in the amount of the biomarker in the second biological sample (post administration of the cdk modulating agent) compared to the amount of biomarker in the first biological sample (prior to administration of the cdk modulating agent). If the biomarker is a downregulated biomarker and the level of the biomarker has not decreased a predetermined or detectable amount, or if the rate of decrease of the biomarker level is not sufficiently

5

10

15

20

25

30

high, the treatment can be modified, such as by increasing the dosage or the number of treatments, or by changing the cdk modulating agent being administered to a more effective agent, or by combining the cdk modulating agent being used in the treatment with one or more other cdk modulating agents or therapies, or some combination thereof.

The invention further provides an improvement to a method for treating a patient suffering from a disorder by administration of a cdk modulating agent, wherein the improvement comprises monitoring the level of at least one biomarker in a biological sample taken from the patient at one or more time points during treatment with the agent so as to determine whether an effective amount of the agent is being administered to the patient. An effective amount of the agent is being administered to the patient if the level of a downregulated biomarker in the biological sample detectably decreases, or if a previously observed rate of decrease in the level of the biomarker increases, in response to administration of the agent. In addition, an effective amount of the agent is being administered to the patient if the level of an upregulated biomarker in the biological sample detectably increases, or if a previously observed rate of increase in the level of the biomarker increases, in response to administration of the agent.

The invention further provides an improvement to a method for treating a patient suffering from a disorder by administration of a cdk modulating agent, wherein the improvement comprises monitoring the level of at least one biomarker in a biological sample taken from the patient at one or more time points during treatment with the agent so as to determine when a sufficient time course of treatment with the agent has been completed. In one embodiment, a sufficient time course of treatment with the agent has been completed when the level of a downregulated biomarker detectably decreases below a predetermined level. In another embodiment, a sufficient time course of treatment with the agent has been completed when the level of an upregulated biomarker detectably increases above a predetermined level.

The type of biological sample from which the amount of biomarker is determined will depend on a variety of factors such as the particular biomarker, where and when it is synthesized, where the biomarker may be stored in the tissues, and into what biological tissue or fluid it may be released or otherwise accumulate. Generally,

5

10

15

20

25

30

the biological sample will be selected from the group consisting of blood, a blood component such as serum or plasma, cerebrospinal fluid (CSF), saliva, and urine. In one aspect, the biological sample will be blood, serum, plasma, or CSF, and most preferably blood, serum, or plasma. Where more than one biomarker is analyzed, the analysis can be conducted on the same or different biological samples obtained from the patient.

The amount of the biomarker in a biological sample can be determined using standard techniques known in the art. For example, each biomarker can be assayed using biomarker-specific antibodies and immunological methods known in the art. Any appropriate immunoassay method can be used, including radioimmunoassays, sandwich enzyme-linked immunoassays, competitive binding assays, homogeneous assays, and heterogeneous assays. Alternatively, the amount of biomarker can be determined using other techniques such as magnetic resonance spectroscopy, HPLC, or mass spectrometry. In any case, the assay method selected should be sensitive enough to be able to measure the particular biomarker in a concentration range from normal values found in healthy patients to elevated levels indicating neurological damage. The assay can be carried out in various formats including, e.g., in a microtiter plate format, using automated immunoassay analyzers known in the art.

As used herein, the predetermined level of the biomarker in the biological sample refers to that amount or concentration of the particular biomarker in a biological sample wherein the amount of the biomarker is higher (upregulated biomarkers) or lower (downregulated biomarkers) statistically than that determined to be present in a biological sample obtained from the patient absent the treatment with the cdk modulating agent. The predetermined level depends upon the particular biomarker.

The expression level of the biomarker provides information about the patient's likely response to treatment with a cdk modulating agent. For this purpose, it is often desirable to correct for (normalize away) both differences in the amount of RNA assayed and variability in the quality of the RNA used. Therefore, the assay typically measures and incorporates the expression of certain normalizing genes, including well known housekeeping genes, such as GAPDH and CYPL. Alternatively, or in addition, normalization can be based on the mean or median signal (Ct in the case of

RT-PCR) of all of the assayed genes or a large subset thereof (global normalization approach). On a gene-by-gene basis, measured normalized amount of a patient tumor mRNA is compared to the amount found in a reference set of cancer tissue of the same type. The number (N) of cancer tissues in this reference set should be sufficiently high to ensure that different reference sets (as a whole) behave essentially the same way. If this condition is met, the identity of the individual cancer tissues present in a particular set will have no significant impact on the relative amounts of the genes assayed. The cancer tissue reference set can, in one aspect, consist of at least about 30 different cancer tissue specimens.

While the data described herein were generated in cell lines that are routinely used to screen and identify compounds that have potential utility for cancer therapy, the biomarkers may have both diagnostic and prognostic value in other diseases areas in which cdk or pathways in which cdk is involved is of importance, e.g., in immunology, or in cancers or tumors in which cell signaling and/or proliferation controls have gone awry.

Those having skill in the pertinent art will appreciate that cdk and pathways in which cdk is involved are used and functional in cell types other than cell lines of ovarian carcinoma cells and peripheral blood mononuclear cells. Therefore, the biomarkers and biomarker sets of the invention may show utility in cells from other tissues or organs associated with a disease state, or cancers or tumors derived from other tissue types. Non-limiting examples of such cells, tissues and organs include breast, colon, lung, prostate, testes, ovaries, cervix, esophagus, pancreas, spleen, liver, kidney, stomach, lymphocytic and brain, thereby providing a broad and advantageous applicability to the biomarkers described herein. Cells for analysis can be obtained by conventional procedures as known in the art, for example, tissue biopsy, aspiration, sloughed cells, e.g., colonocytes, clinical or medical tissue or cell sampling procedures.

### **EXAMPLES:**

5

10

15

20

25

30

As described below, transcription profiling was used to identify the biomarkers provided above in Table 1. Specifically, transcription profiling of the effect of a certain cdk2 inhibitor on peripheral blood mononuclear cells (PBMCs) was

first performed. Next, profiling of a cdk2 inhibitor-treated tumor cell line A2780 at multiple doses and time points was performed to establish a correlation of tumor site response with peripheral blood biomarkers. In order to establish the molecular target-specificity of the potential biomarkers, tumor cell line A2780 treated with anti-cdk2 oligonucleotides was also profiled. Overlapping gene expression changes, as shown in FIG. 1, were selected for further evaluation in human ovarian carcinoma xenograft A2780 that were treated with the cdk2 inhibitor (Example 2). The selected biomarkers were subjected to real-time PCR analysis in order to verify the observed changes from the gene chip analysis. These biomarkers are provided above in Table 1.

In the examples below, the following conditions were employed.

Cdk2 Inhibitor: The cdk2 inhibitor of the examples is N-5-[[5-(1,1-Dimethylethyl)-2-oxazolyl]methyl]thio]-2-thiazolyl-4-piperidinecarboxamide, 0.5-L-tartaric acid salt:

$$\begin{array}{c|c} & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & &$$

### 0.5 L-Tartaric acid salt

15

20

25

5

10

This cdk2 inhibitor was solubilized in 100% DMSO at a concentration of 10 mM. Compound dilutions were made into respective growth media.

Cell Culture: The cell lines were maintained in RPMI-1640 plus 10% fetal bovine serum.

Clonogenic Growth Assay: The colony growth inhibition was measured for the A2780 ovarian carcinoma cells using a standard clonogenic assay. In this assay, 200 cells/well were seeded into 6-well tissue culture plates (FalconTM) (Becton, Dickinson and Company, Franklin Lakes, New Jersey, USA) and allowed to attach for 18 hours. Assay medium consisted of RPMI-1640 plus 10% fetal bovine serum. Cells were then treated in duplicate with a six concentration dose-response curve. The maximum concentration of DMSO never exceeded 0.25%. Cells were exposed to the cdk2 inhibitor for 4, 8, or 24 hours. The cdk2 inhibitor was then removed and the cells were washed with 2 volumes of PBS. The normal growth medium was then

replaced. Colonies were fed with fresh media every third day. Colony number was scored on day 10-14 using a Optimax imaging station. The cdk2 inhibitor concentration required to inhibit 50% or 90% of colony formation (IC₅₀ or IC₉₀, respectively) was determined by non-linear regression analysis. The coefficient of variance (standard deviation/mean, n=3) = 30%.

5

10

15

20

25

30

Real-Time Quantitative PCR Assays: A Taqman® real-time-PCR fluorogenic assay (Applied Biosystems, Foster City, California, USA) was used to quantitate the levels of specific mRNA. The cdk2 inhibitor treated A2780s cells were harvested at approximately 70% confluence and total RNA was prepared using the Qiagen RNeasy 96 Kit.

Taqman® reactions were prepared as follows: 100 ng total RNA; 25 nM – 750 nM Forward Primer; 25 nM – 750 nM Reverse Primer; 200 nM – 400 nM Taqman® Probe (fluorescent dye labeled oligonucleotide primer); 1 X Buffer A (Applied Biosystems, Foster City, California, USA); 5.5 mM MgCl₂; 300 μM dATP, dGTP, dTTP, dCTP; 1 U Amplitaq Gold; 20 U Superscript 2; 1 U RNase Inhibitor. Realtime PCR was performed using an Applied Biosystems 7700 Sequence Detection System. Conditions were as follows: 48 °C for 20 minutes (reverse transcription), 95 °C for 10 minutes (denaturation and activation of Amplitaq Gold), 40 cycles of PCR (95 °C for 15 seconds, 60 °C for 1 minutes).

The Sequence Detection System generates a Ct (threshold cycle) value that is used to calculate a concentration for each input messenger RNA template. Messenger RNA levels for each gene or fragment thereof of interest were normalized to GAPDH message levels to compensate for variations in total RNA quantity in the input sample. This was done by generating GAPDH Ct values for each cell line. Ct values for the gene or fragments thereof of interest and GAPDH were inserted into the  $\delta\delta$ Ct equation:

Relative Quantity of Nucleic Acid Template  $=2^{\delta\delta Ct}=2^{(\delta Cta-\delta Ctb)}$ ( $\delta Cta=Ct$  target – Ct GAPDH,  $\delta Ctb=Ct$  reference – Ct GAPDH)

Gene Chip Analysis: Gene chips were used to quantitate the levels of gene expression on a large-scale with Affymetrix human gene chips HG-U95A, B, and C

which was used to calculate a normalized relative message level.

(Affymetrix, Inc., Santa Clara, California, USA). Gene chip hybridization was performed using an Affymetrix gene chip system including hybridization oven, washing station, scanner, and a computer workstation. Manufacturer's standard protocol was followed. Raw data were generated using Affymetrix Microarray Suite 4.0 software. A threshold of 20 units was assigned to any gene with a calculated expression level below 20, because discrimination of expression below this level could not be performed with confidence.

30

In Vitro Treatment of PBMC: PBMCs were isolated and incubated with the cdk2 inhibitor *in vitro*. Specifically, approximately 40 ml of blood were collected for the pilot study and then from 10 volunteers. The 40 ml of blood were then put into five VacutainerTM CPTTM Mononuclear Cell Preparation Tubes (Product Number: 362753) (Becton, Dickinson and Company, Franklin Lakes, New Jersey, USA) with Sodium Heparin Anticoagulant 60/cs. Lymphocytes were then removed from the five VacutainersTM pool and re-suspended in 20 ml of culture medium (RPMI, 10% serum, and glu/Pen/strep). Cells were counted at this step, and then centrifuged gently and then suspended with 4.0 ml of culture medium. Cells were then plated into 6 well plates (0.5 ml/well). Culture medium containing the cdk2 inhibitor or vehicle (3.5 ml) was then added to each well to give a final concentration of 100 nM cdk2 inhibitor in experimental wells, and also a final concentration of 1000 nM cdk2 inhibitor in experimental wells for the 10 subjects.

RNA and protein samples were harvested at 4 and 24 hours after addition of the cdk2 inhibitor. RNA was prepared using the RNeasy-mini RNA kit according to the manufacturer's specifications (Qiagen, Valencia, California, USA). For protein samples, cells were washed once with PBS before extracting with 0.5-1.0 ml of modified RIPA buffer [50 mM Tris (pH 8), 150 mM NaCl, 1% NP-40, 0.5% Nadeoxycolate, 0.1% SDS, 0.1% Na3VO4, 0.1 mM NaF, 10 mM β-glycerophosphate, plus Complete[®] protease inhibitors (Boehringer Mannhiem GmbH, Germany)]. Lysates were frozen at –80 °C. Viability of cells at different time points following the cdk2 inhibitor treatment was determined by trypan blue exclusion.

Western Blot Analysis: The cdk2 inhibitor treated A2780s cells were harvested at approximately 70% confluence and total protein was prepared by lysing the cells in RIPA [50 mM Tris (pH 8), 150 mM NaCl, 1% NP-40, 0.5% Na-

5

10

15

30

deoxycolate, 0.1% SDS, 0.1% Na3VO4, 0.1 mM NaF, 10 mM β-glycerophosphate, plus Complete® protease inhibitors (Boehringer Mannhiem GmbH, Germany)] buffer. Cell pellets were resuspended at a density of  $\leq 2 \times 10^7$  cells/ml and incubated for 20 minutes on ice followed by a high speed 14,000 rpm centrifugation. The protein supernatant was then removed from the debris and protein content was quantitated using the Micro-BCA assay (Pierce Biotechnology, Inc., Rockford, Illinois, USA). Treated extracts (25 µg/lane) were then separated using a 10% SDS-polyacrilamide gel (10.5 x 14 cm). Proteins were then transferred from the gel to PVDF-membrane (Millipore Corporation, Billerica, Massachusetts, USA) by exposure to 0.8 Amp/cm² in a semi-dry blotting apparatus (Hoefer Scientific Instruments, San Francisco, California, USA). PVDF protein blots were then blocked with 5% non-fat milk in TTBS (0.1% Tween 20 in Tris-buffered saline). Blots were then probed with primary antibody (mouse anti-cdk2 clone D-12, Santa Cruz Biotechnology, Santa Cruz, California, USA) in 5% non-fat milk in TTBS for 1-2 hours, followed by three washes with TTBS. An HRP-conjugated secondary antibody (HRP conjugated goat antimouse IgG, Promega Corp., Madison, Wisconsin, USA) was then incubated with the blots in TTBS for 30 minutes. The blots were then washed three times with TTBS and developed with ECL-plus western blotting detection system (Amersham Biosciences, Piscataway, New Jersey, USA).

Cdk2 Antisense Treatment: A mixture of five antisense oligonucleotides targeted against cdk2 mRNA having the following sequences was used:
GCAGUAUACCUCUCGCUCUUGUCAA (SEQ ID NO:2775);
UUUGGAAGUUCUCCAUGAAGCGCCA (SEQ ID NO:2776);
GUCCAAAGUCUGCUAGCUUGAUGGC (SEQ ID NO:2777);
CCCAGGAGGAUUUCAGGAGCUCGGU (SEQ ID NO:2778);
UAGAAGUAACUCCUGGCCACACCAC (SEQ ID NO:2779). All gene modulations were based on relative levels of RNA in antisense treated cells versus

reverse control oligonucleotide treated cells.

A2780s cells were plated in 6-well tissue culture plates at a density of 1-2 X 10⁵ cells/well. After an overnight incubation, cells were transfected with the antisense oligonucleotide mixture using Lipofectamine 2000 (Invitrogen Life Technologies, Carlsbad, California, USA). Briefly, a 10X lipid solution (10 ug/ml in OptiMEM)

and a 10X oligonucleotide mixture (0.5 uM in OptiMEM) were prepared. A 5X solution of lipid/oligonucleotide complex was then prepared by mixing equal volumes of 10X lipid solution and 10X oligonucleotide mixture. The 5X solution of lipid/oligonucleotide complex was allowed to incubate at room temperature for 15 minutes to allow complexes to form. After incubation, the 5X lipid/oligonucleotide complex was diluted in RPMI containing 10% Fetal Bovine Serum to produce a 1X transfection reagent. Cells in 6-well culture plates were transfected by replacing the overnight growth media with 1X transfection reagent. Cells were then incubated at various times (0, 12, 16, 20, and 24 hours) prior to harvesting RNA for analysis by Taqman® real-time-PCR fluorogenic assay. In every experiment, an extra well was transfected with a fluoresceinated random oligonucleotide to determine the transfection efficiency using flow cytometry. For all experiments, between 85% and 95% of A2780s cells were transfected.

15 Example 1 - Transcription Profiling of Peripheral Blood Mononuclear Cells (PBMCs) Following Treatment with Cdk2 Inhibitor, and A2780S Ovarian Carcinoma Cells Following Treatment with Cdk2 Inhibitor or Anti-cdk2 Antisense Oligonucleotides

To identify biomarkers, transcriptional profiling was obtained for (i) PBMCs following treatment with cdk2 inhibitor, (ii) A2780S ovarian carcinoma cells following treatment with cdk2 inhibitor, and (iii) A2780S ovarian carcinoma cells following treatment with anti-cdk2 antisense oligonucleotides.

Table 2 lists the doses and time course used for treatment of the A2780 and PBMC cell types.

Cell Type	Treatment	Drug Dose (nM)	Time course (hours)
A2780	cdk2 inhibitor	0, 20, 100, 200	0, 1, 2, 4, 6, 24
PBMC (pooled 10 subjects)	cdk2 inhibitor	0, 100	0, 4, 24
PBMC (pilot)	cdk2 inhibitor	0, 100, 1000	0, 4, 24
A2780	Anti-cdk2 oligonucleotide	Antisense oligo and control	0, 12, 16, 20, 24

Table 2 - Experimental design

5

10

20

Treatment of A2780 and PBMC was carried out as described above. The doses of the cdk2 inhibitor were derived from an understanding of the kinetics of tumor cell growth inhibition by the cdk2 inhibitor as assessed by proliferation and clonogenic assays (Table 3). This study clearly demonstrated that growth inhibition by the cdk2 inhibitor was time dependent. A minimal exposure of 8 hours was required for effective inhibition of colony formation. The values obtained from the 24 hour clonogenic assay were in good agreement with the 72 hour proliferation assay.

	IC ₅₀ (nM)	IC ₉₀ (nM)
A2780s Clonogenic assay, 4 hr. exposure	302	> 1000
A2780s Clonogenic assay, 8 hr. exposure	154	303
A2780s Clonogenic assay, 24 hr. exposure	166	208
A2780s, 72 hr. XTT assay	95	170

Table 3- Inhibition of colony formation by cdk2 inhibitor

A pilot experiment of *ex vivo* treatment of PBMC from one healthy volunteer with the cdk2 inhibitor was first performed. Subsequently, PBMCs from ten healthy human subjects were collected and treated *ex vivo* with the cdk2 inhibitor. Total RNA was isolated and hybridized to gene chips.

Antisense inhibition of cdk2 expression was optimized for A2780 cells and carried out as described above. Under these conditions, cdk2 protein levels decreased 90% after 24 hours exposure. As shown in FIG. 2A, consistent reduction of cdk2 protein was observed in all three antisense treated wells (AS) relative to the controls wells (C). This resulted in a block in cell cycle progression and apoptosis that is similar to the cdk2 inhibitor treated A2780s cells. The decrease in cdk2 protein in relation to time of exposure was also determined. As shown in FIG. 2B, cdk2 levels were maximally inhibited at 12 hours and protein levels remained reduced through 24 hours.

### Example 2 - Selection of Biomarkers

5

10

15

20

In order to identify biomarkers for the cdk2 inhibitor that can be used as surrogate endpoints in PBMC and have molecular target-specific response, the

5

10

15

20

25

30

expression profiles of the three sets of experiments in Example 1 were compared. Overlapping gene expression changes were selected as shown in FIG. 1.

To allow for the identification of cdk2 specific responses as well as compound specific changes at gene expression level, a statistical method was used to select genes that have gene expression changes associated with dose and time of treatment in the cdk2 inhibitor treated A2780s sample set. The data were analyzed using an analysis of variance (ANOVA) model to study the compound's dose effect and time effect on each gene. First, the data were rescaled to eliminate the chip effects by a linear regression technique. Then, an ANOVA model was fitted for each gene based on two factors – dose and time. The F-test was used to determine if there was significant dose or time effect in terms of the changes in the expression level of a particular gene. Genes with the p-value less than 0.05 in both dose effect test and time effect test were identified. The genes identified with a p-value of less than 0.05 in both dose effect and time effect are provided Table 1.

Overlapping gene expression changes from the three sets of Example 1 were selected for further evaluation in human ovarian carcinoma xenograft A2780 treated with the cdk2 inhibitor.

The human ovarian carcinoma xenograft A2780s were maintained in Balb/c nu/nu nude mice. Tumors were propagated as subcutaneous (sc) transplants using tumor fragments obtained from donor mice. For the cdk2 inhibitor treatment, tumors were allowed to grow to the pre-determined size window of approximately 100-200 mg (tumors outside the range were excluded) and animals were evenly distributed to various treatment and control groups (n=6). Treatment of each animal was based on individual body weight.

The cdk2 inhibitor was first dissolved in a mixture of Cremophor®/ethanol (50:50). One hour prior to administration, the cdk2 inhibitor was diluted with water so that the dosing solutions contained the specified excipient composition, i.e., Cremophor®/ethanol/water (1:1:8, v/v). The volume of all compounds injected was 0.01 ml/gm of mice. The cdk2 inhibitor was administered as a bolus injection intraperitoneal at doses of 36 and 18 mg/kg. Tumor and plasma were sampled at the time points of 4, 7, and 24 hour post treatment. Plasma sample was frozen

immediately at -80  $^{\circ}$ C for pharmacokinetic analysis, and tumor sample was preserved in RNAase free buffer for pharmacogenomic analysis.

Once certain genes were selected as potential biomarkers, real-time PCR assays using fluorescent MGB Taq-man probes were developed as described above. The selected genes were subjected for real-time PCR analysis as described above in order to verify the observed changes from gene chip analysis.

The biomarker W28729 (SEQ ID NO: 1246) was selected as a preferred marker. A same-well multiplex real-time quantitative PCR assay on this biomarker with normalization control, house-keeping gene GAPDH, was developed using Taqman MGB probes. Gene expression changes for W28729 were measured with real-time quantitative PCR assays in the following sample sets: A2780 human tumor cell line treated with 20 nM of cdk2 inhibitor for different durations (FIG. 3A), PBMC treated with 100nM cdk2 inhibitor at 4 hours (FIG. 3B); and human ovarian carcinoma xenograft A2780 treated with cdk2 inhibitor at doses of 36 and 18 mg/kg for different durations (FIG. 3C). In cultured A2780 tumor cells, induction of W28729 occurred upon treatment with 20 nM of cdk2 inhibitor, and was detected 1h after treatment. Upregulation of W28729 expression was also observed upon treatment of human PBMC in vitro with the cdk2 inhibitor. Treatment of nude mice bearing A2780 xenografts with efficacious doses of the cdk2 inhibitor also resulted in induction of W28729, and there was a dose-dependent prolongation of the duration of gene induction.

## Example 3 - W28729 upregulation

5

10

The following experimental methods were used to further study W28729 upregulation.

Patient inclusion criteria: The patient inclusion criteria included: primary solid malignancy refractory to current therapy and adequate bone marrow, hepatic, and renal function.

Treatments: Two different treatments were undertaken: (i) 174-001 Study: 1 hr infusion of BMS-387032 q 3 wks; and (ii) 174-002 Study: 24 hr infusion of BMS-387032 q 3 wks. The sampling times were pre-dose, and 2, 6, 24 hour post-dose.

W28729 Expression Analysis: RT-PCR. Patient blood samples were collected in PAXgene[™] Blood Collection Tubes (Qiagen, catalog #762155). Total RNA was isolated following the manufacturer's instructions using a PAXgene[™] blood RNA Kit (Qiagen, catalog #762134). W28729 and GAPDH (housekeeping gene) RNA abundance was measured by Taqman assays, using an ABI PRISM 7900 HT Sequence Detection System. W28729 abundance was normalized relative to GAPDH. Primer and probe sequences are as shown below.

W28729:

30

- (5+) AGTACCGTGAGGTTCCTGATGTG (SEO ID NO:2780)
- (3+) TGCCAAGCTGAGATCCTAAGG (SEQ ID NO:2781)

10 Probe TTATGCGGCACGCTT (SEQ ID NO:2782)

GAPDH:

- (5+) CGACAGTCAGCCGCATCTT (SEQ ID NO:2783)
- (3+) AAATCCGTTGACTCCGACCTT (SEQ ID NO:2784)

Probe CATCGCTCAGACACCA (SEQ ID NO:2785)

### Results

15 Preclinical Xenografts: In A2780 xenografts given bolus i.p. treatments with BMS-387032, the induction of W28729 in the tumors occurred in a transient, dosedependent manner (FIG. 4A). At the minimum efficacious dose (MED) of 18 mg/kg/day, the induction was sustained for more than 6 hours. In an infusion regimen using the minimum efficacious dose of 40 mg/kg, gene induction was sustained for at 20 least 16 hours. The gene induction in tumors was accompanied by a strikingly similar pattern of induction of the mouse ortholog sequence (SEQ ID NO:2786; a fragment of mouse genomic DNA sequence locus AL590994), as detected in PBMC isolated from the tumor mice (FIG. 4B). Treatment with an efficacious regimen results in > 2 fold induction of the sequence for 6 hours or longer. These data support the use of 25 W28729 gene induction in tumor as a pharmacodynamic biomarker. In addition, these observations support the use of PBMC as a surrogate tissue for monitoring changes in gene expression, that result from treatment with the cdk2 inhibitor.

Clinical Trials: In the CA174-001 study (1 hour infusion), transient induction of W28729 was detected in PBMC at 2 hours and returned to baseline levels by 6 hours (FIG. 5A). In the CA174-002 study (24 hour infusion), there was modest induction of W28729 expression, which was sustained for 6 hours following end of infusion (FIG. 5B). Each line in FIGS. 5A and 5B represents the extent of gene

induction for an individual patient at the specified times after dosing. There was an inverse relationship between baseline expression and the level of maximal gene induction in the CA174-001 study (FIG. 6A). There was no clear relationship between baseline expression and induction magnitude in the CA174-002 study (FIG. 6B). Interpretation of the data from the 24 hour infusion study is difficult because expression data were collected more than 24 hours after the beginning of dosing.

5

10

15

20

FIGS. 7A and 7B illustrate W28729 induction as a function of dose (FIG. 7A) and AUC (FIG. 7B) from the CA174-001. As shown in FIGS. 7A and 7B, there was a linear relationship between W28729 gene induction and dose or exposure of the cdk2 inhibitor. FIG. 8 provides a prediction of W28729 changes by baseline expression of W28729 and the cdk inhibitor exposure in the CA174-001 study. W28729 gene expression changes can be predicted by the formula:  $\Delta$ (W28729 expression) = A*AUC*(Baseline expression)^B, wherein A = 0.000619 and B = -0.537. Induction of W28729 gene can be reliably predicted from drug exposure and baseline W28729 expression.

Since the pre-clinical data suggest that the extent and duration of W28729 gene induction correlate with anti-tumor efficacy, the disease outcome of patients who showed different W28729 induction in the CA174-001 study was examined. Interestingly, those patients with high induction appeared to have the most favorable outcome (FIG. 9). These results suggest that W28729 induction is a surrogate marker for prediction of clinical outcome of agents that modulate cdk.

### **CLAIMS:**

5

10

15

20

30

What is claimed is:

1. A method for testing or predicting whether a mammal will respond therapeutically to a method of treating cancer comprising administering an agent that modulates cdk activity, wherein the method comprises:

- (a) measuring in the mammal the level of the nucleotide sequence of SEQ ID NO:1246;
  - (b) exposing the mammal to the agent that modulates cdk activity; and
- (c) following the exposing of step (b), measuring in the mammal the level of the nucleotide sequence of SEQ ID NO:1246,

wherein a difference in the level of the nucleotide sequence of SEQ.ID NO:1246 measured in step (c) compared to the level of the nucleotide sequence of SEQ ID NO:1246 measured in step (a) indicates that the mammal will respond therapeutically to said method of treating cancer.

- 2. The method of claim 1 wherein said agent is N-5-[[5-(1,1-Dimethylethyl)-2-oxazolyl]methyl]thio]-2-thiazolyl-4-piperidinecarboxamide, 0.5-L-tartaric acid salt.
- 3. A method for determining whether a mammal is responding to an agent that modulates cdk activity, comprising:
  - (a) obtaining a biological sample from the mammal;
- (b) measuring in said biological sample the level of the nucleotide sequence of SEQ ID NO:1246;
  - (c) correlating said level of the nucleotide sequence of SEQ ID NO:1246 with a baseline level; and
- (d) determining whether the mammal is responding to an agent that modulates cdk activity based on said correlation.
  - 4. The method of claim 3 wherein said agent is N-5-[[5-(1,1-Dimethylethyl)-2-oxazolyl]methyl]thio]-2-thiazolyl-4-piperidinecarboxamide, 0.5-L-tartaric acid salt.
  - 5. A method for testing or predicting whether a mammal will respond therapeutically to a method of treating cancer comprising administering an agent that modulates cdk activity, wherein the method comprises:
  - (a) measuring in the mammal the level of at least one biomarker selected from the biomarkers of Table 1;

(b) exposing the mammal to the agent that modulates cdk activity;

(c) following the exposing of step (b), measuring in the mammal the level of the at least one biomarker,

wherein a difference in the level of the at least one biomarker measured in step (c) compared to the level of the at least one biomarker measured in step (a) indicates that the mammal will respond therapeutically to said method of treating cancer.

- 6. The method of claim 5 wherein said agent is N-5-[[5-(1,1-Dimethylethyl)-2-oxazolyl]methyl]thio]-2-thiazolyl-4-piperidinecarboxamide, 0.5-L-tartaric acid salt.
  - 7. The method of claim 5 wherein the at least one biomarker is a protein.
- 8. The method of claim 5 wherein the at least one biomarker is an mRNA transcript.
- 9. A method for determining whether a mammal is responding to an agent that modulates cdk activity, comprising:
  - (a) obtaining a biological sample from the mammal;

5

10

- (b) measuring in said biological sample the level of at least one biomarker selected from the biomarkers of Table 1;
  - (c) correlating said level of at least one biomarker with a baseline level; and
  - (d) determining whether the mammal is responding to an agent that modulates cdk activity based on said correlation.
- 20 10. A method for determining whether a mammal is responding to an agent that modulates cdk activity, comprising:
  - (a) exposing the mammal to the agent; and
  - (b) following the exposing of step (a), measuring in the mammal the level of at least one biomarker selected from the biomarkers of Table 1.
- wherein a difference in the level of the at least one biomarker measured in step (b), compared to the level of the at least one biomarker in a mammal that has not been exposed to said agent, indicates that the mammal is responding to the agent that modulates cdk activity.
